Abstract

Scientific knowledge gathered over millions of years and its application to general human life has brought drastic changes. Its charisma can be seen in all spheres, from medical miracles that prolonged human life to travel that made it possible to go around the world in shorter duration. Artificial intelligence has helped to improve the capability of human mind. Communication and Wireless technology allows us to connect to any part of the universe with the blink of an eye and weather forecasting provides humans quite an edge against the calamities of nature. This advancement has not come for free and it had its own cost. On one hand science made us reach the stars and on the other indiscriminate use of it has botched our natural inclination. Our extravagant dependence on technology has lulled our senses. The human race has certainly gained much through the progression of science but we have to stop once to consider all that has been lost in this blind race. History stands as a proof that progression of science has always been human-friendly, hence its advancement can-not always be considered for advancement of human race. The concept that advancing science and human welfare do always go hand in hand has been nakedly depicted in Aldous Huxley's Utopian- Dystopian novel "BraveNew World".

"Brave New World" is a science- fiction novel published in 1932. It is penned by British writer Aldous Huxley. Huxley in his magnum opus does not shy away from portraying ugliest picture of unchecked use of technology. This is one of the most popular books describing the exploits of genetic engineering, cloning and misuse of behavioural science.

Keywords: Genetic Engineering, Cloning, Behavioural Science, Psychology, Science Fiction, Totalitarianism, Mass Production.
